

General Description

The DSC400-1111Q0110 is a four output crystal-less™ clock generator. It utilizes Microchip's proven PureSilicon™ MEMS technology to provide excellent jitter and stability while incorporating additional device functionality.

The frequencies of the outputs can be identical or independently derived from two shared PLLs. Each output may be configured independently to support LVCMOS, LVPECL, LVDS, or HCSL output standards.

The DSC400-1111Q0110 provides two independent select lines for choosing between two sets of pre-configured frequencies per bank. It also has two OE pins to allow for enabling and disabling outputs.

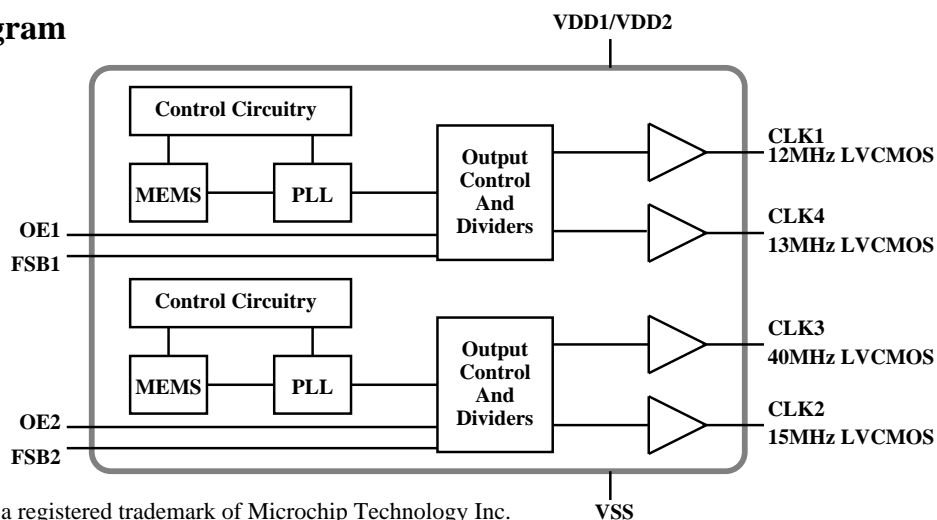

Applications

- Communications and Networks
- Ethernet
 - 1G, 10GBASE-T/KR/LR/SR, and FCoE
- Storage Area Networks
 - SATA, SAS, Fibre Channel
- Passive Optical Networks
 - EPON, 10G-EPON, GPON, 10G-GPON
- HD/SD/SDI Video & Surveillance
- Automotive
- Media and Video
- Embedded and Industrial

Features

- Frequencies and output formats:
 - 12MHz LVCMOS x 1
 - 15MHz LVCMOS x 1
 - 40MHz LVCMOS x 1
 - 13MHz LVCMOS x 1
- Low RMS phase jitter: <1ps (typ)
- High stability: ±50ppm, ±25ppm
- Wide temperature range
 - Industrial: -40°C to +85°C
 - Ext. commercial: -20°C to +70°C
- High supply noise rejection: -50dBc
- Available pin-selectable frequency table
 - 1 pin per bank for 2 frequency sets
- Excellent shock & vibration immunity
 - Qualified to MIL-STD-883
- High reliability
 - 20x better MTF than quartz based devices
- Supply range of 2.25V to 3.6V
- AEC-Q100 automotive qualified
- 20-pin 5mm x 3.2mm QFN package

Operational Description

The DSC400-1111Q0110 is a crystal-less™ clock generator. Unlike older clock generators in the industry, it does not require an external crystal to operate; it relies on integrated MEMS resonators that interface with internal PLLs. This technology enhances performance and reliability by allowing tighter frequency stability over a far wider temperature range. In addition, the higher resistance to shock and vibration decreases the aging rate, greatly improving product life in the system.

Inputs

There are 4 input signals in the device. Each has an internal (40kOhms) pull up, which defaults the selection to a high (1). Inputs can be controlled through hardware strapping method with a resistor to ground to assert the input low (0). Inputs may also be controlled by other components' GPIOs. In case more than one frequency set is desired, FSB1 and FSB2 are used for independently selecting one of two sets frequency per bank. FSB1 selects the pre-configured frequency set on Bank 1 (CLK1 and CLK4) and FSB2 selects the pre-configured frequency set on Bank 2 (CLK3 and CLK2). If there is a requirement to disable outputs, the inputs OE1 and OE2 are used to disable the banks of outputs. Outputs are disabled in tristate (Hi-Z) mode, see Table 1 below.

OE1	OE2	Bank 1 (CLK1 and CLK4)	Bank 2 (CLK3 and CLK2)
0	0	Hi-Z	Hi-Z
0	1	Hi-Z	Running
1	0	Running	Hi-Z
1	1	Running	Running

Table 1. Output Enable (OE) Selection Table

Outputs

The four outputs are grouped into two banks. Each bank is supplied by an independent VDD to allow for optimized noise isolation between the two banks. Each bank provides two synchronous outputs generated by a common PLL:

- Bank 1 is composed of outputs CLK1 and CLK4
- Bank 2 is composed of outputs CLK3 and CLK2

Each output maybe pre-configured independently to be one of the following formats: LVCMOS, LVDS, LVPECL or HCSL. In case the output is configured to be single ended (LVCMOS only), the frequency is generated on the true output (CLKx+) and the complement output (CLKx-) is shut off in a low state. Frequencies can be chosen from 2.3MHz to 460MHz for differential outputs and from 2.3MHz to 170MHz on LVCMOS outputs.

Output Clock Frequencies

Output	CLK1	CLK2	CLK3	CLK4
Frequency (MHz)	12	15	40	13

Power

VDD1 and VDD2 supply the power to banks 1 and 2 respectively. Each VDD may have different supply voltage from the other as long as it is within the 2.25V to 3.6V range. Each VDD pin should have a 0.1µF capacitor to filter high frequency noise. VSS is common to the entire device. The exposed die paddle should be connected to VSS.
