

VMMK-2203

0.9-11 GHz E-pHEMT Wideband Amplifier in Wafer Level Package

Data Sheet

Lead (Pb) Free
RoHS 6 fully
compliant

Description

Avago Technologies has combined its industry leading E-pHEMT technology with a revolutionary wafer level package (WLP).

The VMMK-2203 is an easy-to-use GaAs MMIC amplifier that offers excellent gain and noise figure from 0.9 to 11 GHz. The input and output are matched to 50 Ω so no external matching is needed. Bias is supplied through a simple external choke and DC blocking network.

The wafer level package is small and ultra thin, yet can be handled and placed with standard 0402 pick and place assembly. This product is easy to use since it requires only a single positive DC voltage for bias and no matching coefficients are required for impedance matching to 50 Ω systems.

WLP 0402, 1mm x 0.5mm x 0.25 mm

Pin Connections (Top View)

Note:
"D" = Device Code
"Y" = Month Code

Features

- 1 x 0.5 mm Surface Mount Package
- Ultrathin (0.25mm)
- Gain Block
- Ultra-wide Bandwidth
- 5V Supply
- RoHS6 + Halogen Free

Specifications (6GHz, 5V, 25mA Typ.)

- Noise Figure: 2.0dB typical
- Associated Gain: 16.5dB
- Output IP3: +14dBm
- Output P1dB: +5dBm

Applications

- Low Noise and Driver for Cellular/PCS and WCDMA Base Stations
- 2.4 GHz, 3.5GHz, 5-6GHz WLAN and WiMax notebook computer, access point and mobile wireless applications
- 802.16 & 802.20 BWA systems
- WLL and MMDS Transceivers
- Point-to-Point Radio
- UWB
- Antennas

Attention: Observe precautions for handling electrostatic sensitive devices.
ESD Machine Model = 40V
ESD Human Body Model = 450V
Refer to Avago Application Note A004R: Electrostatic Discharge, Damage and Control.

Table 1. Absolute Maximum Ratings^[1]

Sym	Parameters/Condition	Unit	Absolute Max
Vd	Supply Voltage (RF Output) ^[2]	V	8
Id	Device Current ^[2]	mA	50
P _{in,max}	CW RF Input Power (RF Input) ^[3]	dBm	+13
P _{diss}	Total Power Dissipation	mW	400
Tch	Max channel temperature	°C	150
θ _{jc}	Thermal Resistance ^[4]	°C/W	107

Notes

1. Operation in excess of any of these conditions may result in permanent damage to this device.
2. Bias is assumed DC quiescent conditions
3. With the DC (typical bias) and RF applied to the device at board temperature T_b = 25°C
4. Thermal resistance is measured from junction to board using IR method

Table 2. DC and RF Specifications

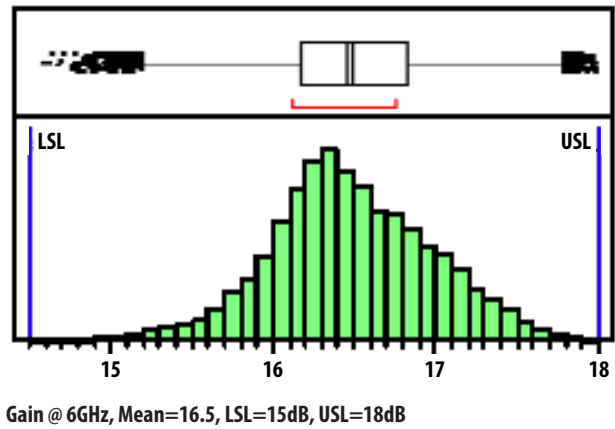

T_A = 25°C, Frequency = 6 GHz, V_d = 5V, Z_{in} = Z_{out} = 50Ω (unless otherwise specified)

Sym	Parameters/Condition	Unit	Minimum	Typ.	Maximum
Id	Device Current	mA	20.0	25	30.0

VMMK-2203 Application and Usage

(Please always refer to the latest Application Note AN5378 in website)

Biasing and Operation

The VMMK-2203 is biased with a positive supply connected to the output pin through an external user supplied bias-tee as shown in Figure 19. The recommended supply voltage is between 3 and 5V. The corresponding drain currents are approximately 15 and 25 mA. Biasing the device at 5V results in higher gain, lower noise figure, higher IP3 and P1dB. In a typical application, the bias-tee can be constructed using lumped elements. The value of the output inductor can have a major effect on both low and high frequency operation. The demo board uses an 8.2 nH inductor that has self resonant frequency higher than the maximum desired frequency of operation.

Figure 19. Usage of the VMMK-2203

At frequencies higher than 6 GHz, it may be advantageous to use a quarter-wave long microstrip line to act as a high impedance at the desired frequency of operation. This technique proves a good solution but only over relatively narrow bandwidths. Another approach for using the VMMK-2203 in broadband is to put in series two different value inductors with the smaller value inductor placed closest to the device and favoring the higher frequencies. The larger value inductor will then offer better low frequency performance by not loading the output of the device. The parallel combination of the 100pF and 0.1uF capacitors provides a low impedance in the band of operation and at lower frequencies. They should be placed as close as possible to the inductor. The low frequency bypass provides good rejection of power supply noise and also provides a low impedance termination for third order low frequency mixing products that will be generated when multiple in-band signals are injected into any amplifier.

Refer the Absolute Maximum Ratings table for allowed DC and thermal conditions.

Figure 20. Evaluation/Test Board (available to qualified customer request)

S Parameter Measurements

The S-parameters are measured on a .016 inch thick RO4003 printed circuit test board, using G-S-G (ground signal ground) probes. Coplanar waveguide is used to provide a smooth transition from the probes to the device under test. The presence of the ground plane on top of the test board results in excellent grounding at the device under test. A combination of SOLT (Short - Open - Load - Thru) and TRL (Thru - Reflect - Line) calibration techniques are used to correct for the effects of the test board, resulting in accurate device S-parameters. The reference plane for the S Parameters is at the edge of the package.

The product consistency distribution charts shown on page 2 represent data taken by the production wafer probe station using a 300um G-S wafer probe. The ground-signal probing that is used in production allows the device to be probed directly at the device with minimal common lead inductance to ground. Therefore there will be a slight difference in the nominal gain obtained at the test frequency using the 300um G-S wafer probe versus the 300um G-S-G printed circuit board substrate method.

Ordering Information
